

Repairing the Future: ABI, Repair Don't Waste, and Alstom Join Forces Again

The fight against electronic waste (e-waste) gains momentum as global train manufacturer, Alstom, equips its latest international site with ABI's advanced electronic diagnostic and reverse engineering systems. This marks a significant milestone – the 12th international location to embrace ABI's BoardMaster and RevEng solutions.

This collaboration between ABI and Alstom strengthens their commitment to the Repair Don't Waste movement. By deploying ABI's technology closer to where their trains operate, Alstom prioritises repairs over replacements, significantly reducing e-waste generation. This translates to cost savings and minimises environmental impact.

Furthermore, establishing a repair facility with ABI's technology fosters the creation of skilled technical jobs. This local expertise ensures efficient repairs, contributing to a more sustainable and cost-effective rail transportation system. Alstom's investment in the 12th international site signifies a global commitment to responsible management of electronics and building a skilled workforce for the future of rail transportation.
